Chapter 11: File-System Interface

Chapter 11: File-System Interface

- ? File Concept
- ? Access Methods
- Disk and Directory Structure
- File-System Mounting
- File Sharing
- ? Protection

Objectives

- ? To explain the function of file systems
- To describe the interfaces to file systems
- To discuss file-system design tradeoffs, including access methods, file sharing, file locking, and directory structures
- To explore file-system protection

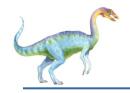

File Concept

- Contiguous logical address space
- ? Types:
 - Data
 - numeric
 - character
 - binary
 - Program
- Contents defined by file's creator
 - Many types
 - Consider text file, source file, executable file

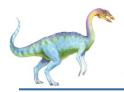

File Attributes

- Name only information kept in human-readable form
- Identifier unique tag (number) identifies file within file system
- Type needed for systems that support different types
- Location pointer to file location on device
- Size current file size
- Protection controls who can do reading, writing, executing
- Time, date, and user identification data for protection, security, and usage monitoring
- Information about files are kept in the directory structure, which is maintained on the disk
- Many variations, including extended file attributes such as file checksum
- Information kept in the directory structure

File info Window on Mac OS X

File Operations

- ? File is an abstract data type
- ? Create
- Write at write pointer location
- Read at read pointer location
- Reposition within file seek
- ? Delete
- ? Truncate
- ? $Open(F_i)$ search the directory structure on disk for entry F_i , and move the content of entry to memory
- ? Close (F_i) move the content of entry F_i in memory to directory structure on disk

Open Files

- Several pieces of data are needed to manage open files:
 - Open-file table: tracks open files
 - Pile pointer: pointer to last read/write location, per process that has the file open
 - File-open count: counter of number of times a file is open to allow removal of data from open-file table when last processes closes it
 - Disk location of the file: cache of data access information
 - Access rights: per-process access mode information

File Types – Name, Extension

file type	usual extension	function
executable	exe, com, bin or none	ready-to-run machine- language program
object	obj, o	compiled, machine language, not linked
source code	c, cc, java, pas, asm, a	source code in various languages
batch	bat, sh	commands to the command interpreter
text	txt, doc	textual data, documents
word processor	wp, tex, rtf, doc	various word-processor formats
library	lib, a, so, dll	libraries of routines for programmers
print or view	ps, pdf, jpg	ASCII or binary file in a format for printing or viewing
archive	arc, zip, tar	related files grouped into one file, sometimes com- pressed, for archiving or storage
multimedia	mpeg, mov, rm, mp3, avi	binary file containing audio or A/V information

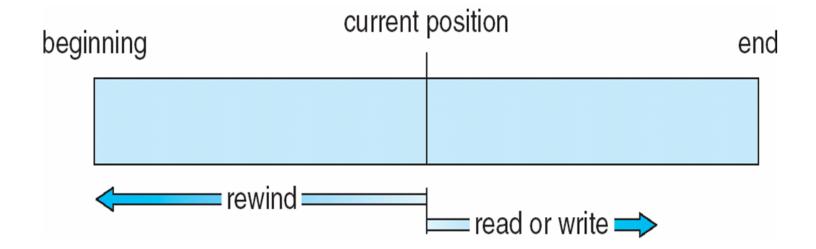

File Structure

- ? None sequence of words, bytes
- Simple record structure
 - ! Lines
 - Fixed length
 - Variable length
- ? Complex Structures
 - Pormatted document
 - Relocatable load file
- Can simulate last two with first method by inserting appropriate control characters
- ? Who decides:
 - Operating system
 - Program

Sequential-access File

Access Methods

? Sequential Access

```
read next
write next
reset
no read after last write
(rewrite)
```

Direct Access – file is fixed length logical records

n = relative block number

Relative block numbers allow OS to decide where file should be placed
 See allocation problem in Ch 12

Simulation of Sequential Access on Direct-access File

sequential access	implementation for direct access	
reset	cp = 0;	
read next	read cp ; cp = cp + 1;	
write next	write cp ; $cp = cp + 1$;	

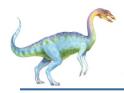

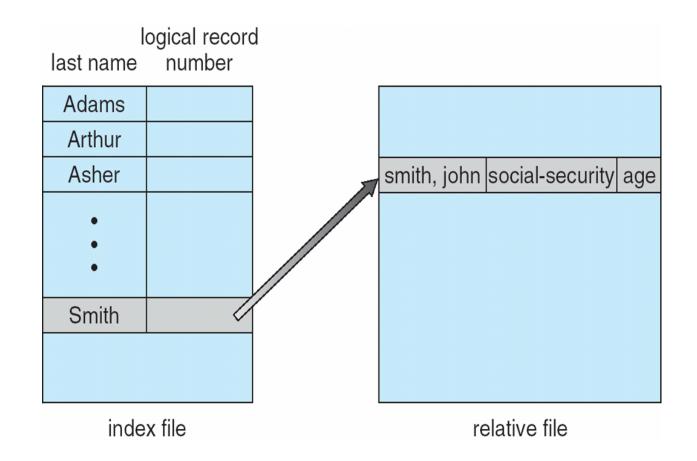

Other Access Methods

- Can be built on top of base methods
- ? General involve creation of an index for the file
- Reep index in memory for fast determination of location of data to be operated on (consider UPC code plus record of data about that item)
- If too large, index (in memory) of the index (on disk)
- IBM indexed sequential-access method (ISAM)
 - Small master index, points to disk blocks of secondary index
 - File kept sorted on a defined key
 - All done by the OS
- VMS operating system provides index and relative files as another example (see next slide)

Example of Index and Relative Files

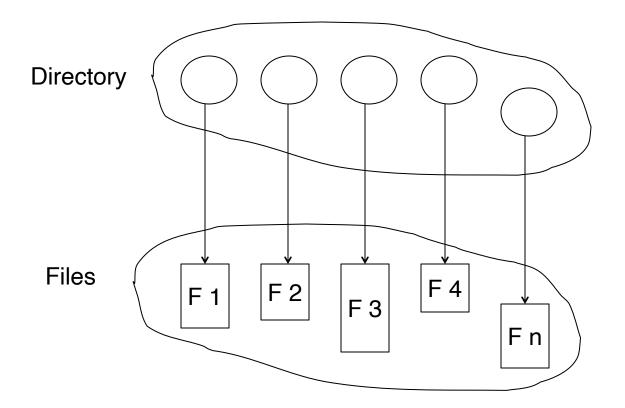

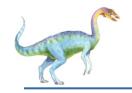

Directory Structure

? A collection of nodes containing information about all files

Both the directory structure and the files reside on disk

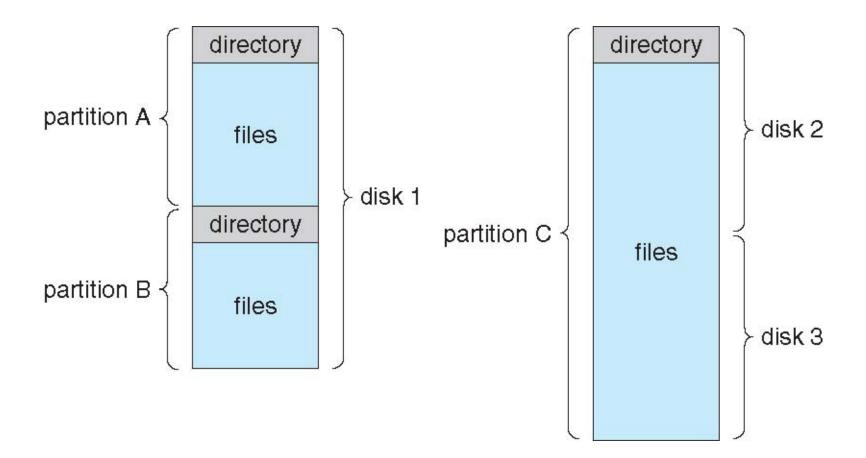

Disk Structure

- Disk can be subdivided into partitions
- Disks or partitions can be RAID protected against failure
- Disk or partition can be used raw without a file system, or formatted with a file system
- ? Partitions also known as minidisks, slices
- Entity containing file system known as a volume
- Each volume containing file system also tracks that file system's info in device directory or volume table of contents
- ? As well as general-purpose file systems there are many special-purpose file systems, frequently all within the same operating system or computer

A Typical File-system Organization

Operations Performed on Directory

- Search for a file
- ? Create a file
- ? Delete a file
- ! List a directory
- ? Rename a file
- Traverse the file system

Organize the Directory (Logically) to Obtain

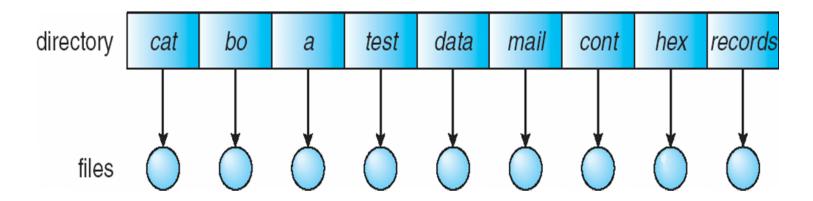

- Efficiency locating a file quickly
- Naming convenient to users
 - Two users can have same name for different files
 - The same file can have several different names
- Grouping logical grouping of files by properties, (e.g., all Java programs, all games, …)

Single-Level Directory

? A single directory for all users

Naming problem

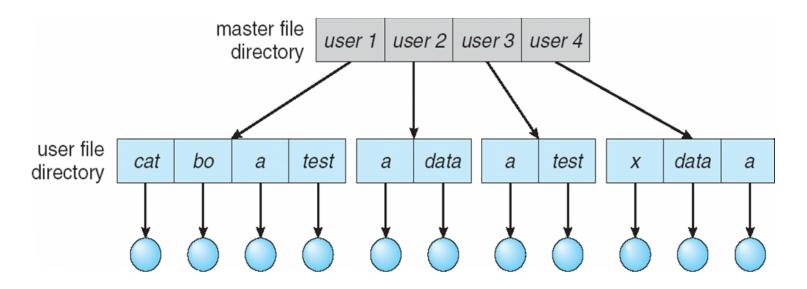

Grouping problem

Two-Level Directory

Separate directory for each user

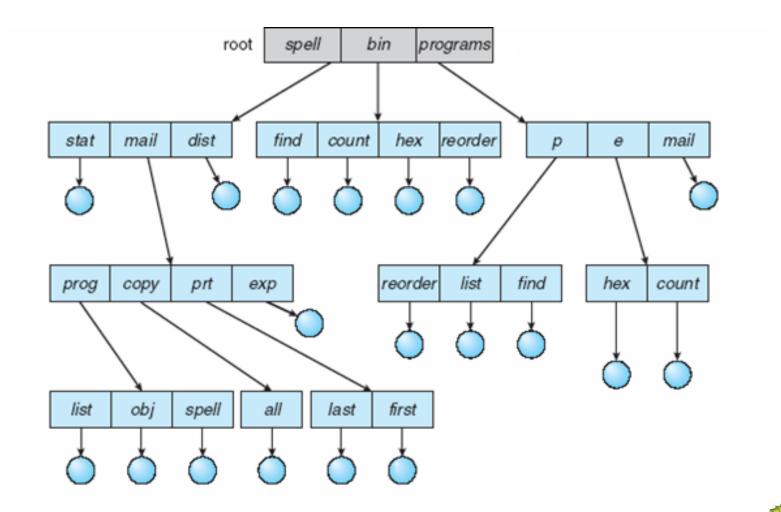

- Path name
- ? Can have the same file name for different user
- Efficient searching
- No grouping capability

Tree-Structured Directories

Tree-Structured Directories (Cont.)

- Efficient searching
- Grouping Capability
- Current directory (working directory)
 - ? cd /spell/mail/prog
 - ? type list

Tree-Structured Directories (Cont)

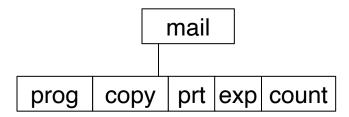

- ? Absolute or relative path name
- Creating a new file is done in current directory
- ? Delete a file

```
rm <file-name>
```

Creating a new subdirectory is done in current directory

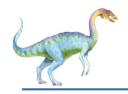

mkdir <dir-name>

Example: if in current directory /mail mkdir count

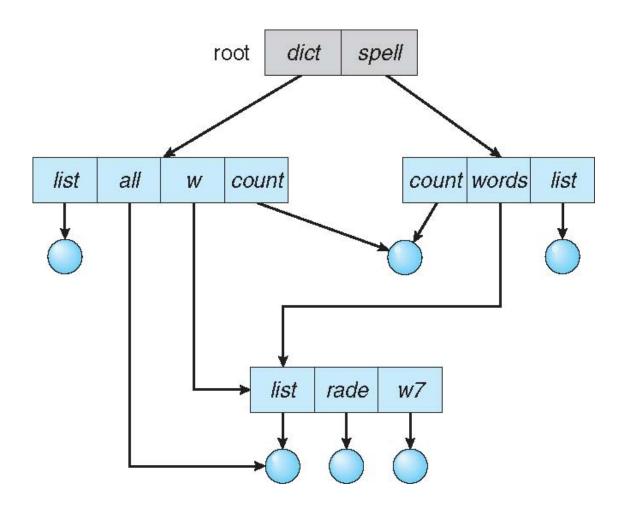

Deleting "mail" ⇒ deleting the entire subtree rooted by "mail"

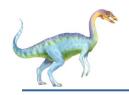

Acyclic-Graph Directories

? Have shared subdirectories and files

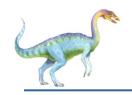

Acyclic-Graph Directories (Cont.)

- Two different names (aliasing)
- If dict deletes list ⇒ dangling pointer

Solutions:

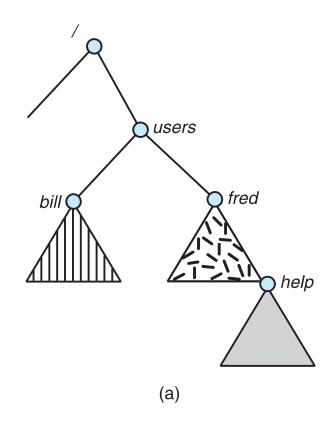

- Backpointers, so we can delete all pointers Variable size records a problem
- Backpointers using a daisy chain organization
- Entry-hold-count solution
- ? New directory entry type
 - Link another name (pointer) to an existing file
 - Resolve the link follow pointer to locate the file

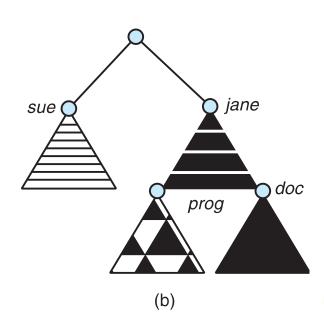

File System Mounting

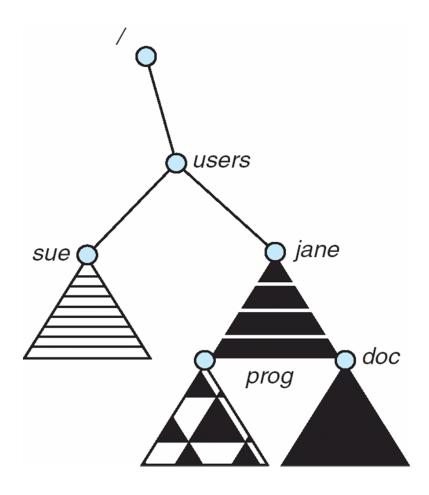

- ? A file system must be mounted before it can be accessed
- A unmounted file system (i.e., Fig. 11-11(b)) is mounted at a mount point

Mount Point

Protection

- ? File owner/creator should be able to control:
 - what can be done
 - by whom
- ? Types of access
 - ? Read
 - Write
 - ? Execute
 - Append
 - ? Delete
 - ? List

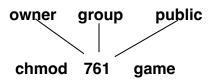

Access Lists and Groups

- Mode of access: read, write, execute
- Three classes of users on Unix / Linux

a) owner access	7	\Rightarrow	111
			RWX
b) group access	6	\Rightarrow	110
			RWX
c) public access	1	\Rightarrow	001

- Ask manager to create a group (unique name), say G, and add some users to the group.
- ? For a particular file (say *game*) or subdirectory, define an appropriate access.

Attach a group to a file

chgrp G game

DIMY

A Sample UNIX Directory Listing

-rw-rw-r	1 pbg	staff	31200	Sep 3 08:30	intro.ps
drwx	5 pbg	staff	512	Jul 8 09.33	private/
drwxrwxr-x	2 pbg	staff	512	Jul 8 09:35	doc/
drwxrwx	2 pbg	student	512	Aug 3 14:13	student-proj/
-rw-rr	1 pbg	staff	9423	Feb 24 2003	program.c
-rwxr-xr-x	1 pbg	staff	20471	Feb 24 2003	program
